

Mountain Prairie Acres: Site Master Grid

One coordinate system for every project on the property: lot feet from the northwest fence corner, 50 ft cells A–G by 1–26, tied to latitude and longitude. Pages and code helpers all read the same data file.

Whole lot, north up, 50 ft cells

Reading a grid reference

Lot feet: x is feet east of the west fence, y is feet south of the north fence. The origin (0, 0) is the northwest fence corner, and the fences run true north–south and east–west.

Cells: a column letter (A–G, west to east) plus a row number (1–26, north to south). Each cell is 50 × 50 ft, so *B19* is x 50–100, y 900–950. Write a spot as *B19* (x 63, y 921).

Lot and location

FENCED LOT

331.3 × 1,291.9 ft

9.83 acres inside the fence

LIKELY PARCEL

330 × 1,320 ft (10 ac)

to the road centerlines; not surveyed

ORIGIN (0, 0)

43.47545, -115.59484

northwest fence corner (NAD83 / GPS)

DRIVEWAY ENTRANCE

43.47550, -115.59364

open in Google Maps (for directions)

LOT AXES

x runs 89.9° true

within 0.2° of due east; y is due south

POSITION ACCURACY

about 10 ft

USGS NAIP-based; a shed GPS pin checks within 5 ft

Feature coordinates

Feature (id)	Cells	Center x, y	Size, ft	Ground, ft	Lat, long
Boundary and access					
Fence (lot line) fence	A1–G26	166, 646	331.3 × 1,291.9	—	43.47368, -115.59421

Old ditch line old_ditch	A20 → G18	165, 912	8 wide	4,759.6	43.47295, -115.59421

Using the grid in code

Web pages load data/site_grid.js (grid, features, latitude/longitude tie) and data/site_terrain.js (lidar elevations), then call SiteGrid:

```
<script src="data/site_grid.js"></script>
<script src="data/site_terrain.js"></script>

SiteGrid.cellOf(63, 921)           // 'B19'
SiteGrid.cellBounds('B19')         // { x0: 50, y0: 900, x1: 100, y1: 950 }
SiteGrid.center('pump_house')      // [73.25, 913.25]
SiteGrid.cellsOf('house_pad')      // ['C19', 'D19', 'E19', 'C20', 'D20', 'E20']
SiteGrid.elevationFt(63, 921)      // 4758.7 (feet above sea level)
SiteGrid.toLatLon(63, 921)         // [43.472925, -115.594594]
SiteGrid.fromLatLon(43.473383, -115.594507) // [86.5, 754.3] (a GPS pin on the shed)
SiteGrid.treeXY(5, 3)              // [74, 505] (orchard tree R5-C3, cell B11)
SiteGrid.mapsLink(63, 921)         // Google Maps link to that spot
```

Scripts and the command line use tools/site_grid.py, which reads the same files:

```
python tools/site_grid.py cell 63 921           # B19
python tools/site_grid.py where B19             # cell bounds and the features in it
python tools/site_grid.py feature pump_house     # center, size, cells, ground, lat/long
python tools/site_grid.py dist pump_house house  # gap and ground change
python tools/site_grid.py tree 5 3              # orchard tree R5-C3: x, y, cell, ground
python tools/site_grid.py fromlatlon 43.473383 -115.594507
from site_grid import SiteGrid; grid = SiteGrid(); grid.cell_of(63, 921); grid.elevation_ft(63, 921)
```

Conventions

- Feet throughout. Elevations are above sea level (NAVD88) from USGS 3DEP lidar flown before the homestead pads were graded.
- Status is existing or planned; planned buildings move once their spots are staked. To add or move something, edit the JSON between the BEGIN and END markers in docs/data/site_grid.js (rect x0/y0/x1/y1, circle cx/cy/r, polygon or line pts, point x/y), then run python -m unittest discover -s tools.
- Latitude and longitude come from the fitted lot frame, good to about 10 ft: fine for maps and directions, not for boundary questions. For precise layout, measure from the fences.
- Buried water lines (2 in PVC solid, 1.5 in dashed) and the 7 frost-free hydrants (blue dots) are traced from the owner's hand-drawn map (October 2026): good to about 5 ft around the homestead and 10 ft at the north end, so dig by hand near them.
